

PROJECT DEVELOPMENT PHASE

1. Incident creation

To create user accounts that will use the application and perform different tasks.

Users are created in ServiceNow to represent employees such as Incident Managers, Support Engineers, and Team Leads. These users are assigned different responsibilities, allowing the system to test notifications, approvals, and SLA monitoring in a real-world environment.

The screenshot shows the ServiceNow Incident form for incident INC0009009. The form is divided into two main sections: the top section for incident details and the bottom section for SLA-related information. The top section includes fields for Number (INC0009009), Caller (David Miller), Category (Software), Subcategory (Email), Service, Service offering, Configuration item, Short description (SLA Breach Awareness and Justification), and Description (SLA Breach Justification). The right side of the form includes fields for Channel (None), State (In Progress), Impact (3 - Low), Urgency (2 - Medium), Priority (4 - Low), Assignment group (Database San Diego), and Assigned to (Don Goodliffe). The bottom section includes fields for SLA Breach Reason (System outage), SLA at Risk (checked), SLA Breach Justification (checked), and SLA Acknowledgement (checked).

2.SLA Definition- Incident Resolution - virtual agent gove

The screenshot shows the ServiceNow SLA Definition form for 'Incident Resolution - Virtual Agent Gove'. The form is divided into two main sections: the top section for SLA details and the bottom section for start and cancel conditions. The top section includes fields for Name (Incident Resolution-Virtual Agent Gove), Type (SLA), Target (Resolution), Table (Incident [Incident]), Flow (Default SLA flow), Application (Global), Duration type (User specified duration), Duration (Days 0, Hours 08, Minutes 00, Seconds 00), Schedule source (SLA definition), Schedule (IT Support Business Hours), and Timezone source (The caller's time zone). The bottom section includes tabs for Start condition, Pause condition, Stop condition, and Reset condition. The Start condition tab is active, showing a condition for 'State is In Progress'. The condition is defined by the following criteria: State is In Progress. The condition is active and retroactive start is checked. The cancel condition is defined by the following criteria: Cancel conditions are met.

3.Update sets creation

An Update Set is created before starting development. It records all configurations such as tables, fields, business rules, UI policies, Flow Designer flows, notifications, Virtual Agent topics, and other customizations related to the SLA Breach Awareness and Justification System.

The screenshot shows the 'Update Set - Virtual Agent for SLAV1' form in ServiceNow. The form includes fields for Name (Virtual Agent for SLAV1), State (In progress), Parent, Release date, Install date, Installed from, and Description (Virtual Agent Driven SLA Breach Awareness and Justification System). It also shows Application (Global), Created (2026-06-20 18:52:36), Created by (admin), and Merged to. Below the form are buttons for 'Update' and 'Delete', and a 'Related Links' section with links like 'Make This My Current Set', 'Merge With Another Update Set', and 'Scan Update Set'. At the bottom, there are tabs for 'Customer Updates', 'Update Set Logs', 'Child Update Sets', and 'Install History', followed by a table header for 'Update set = Virtual Agent for SLAV1' with columns: Created, Type, View, Target name, Updated by, Remote update set, and Action.

4.UI policy - Enforce SLA justification

The screenshot shows the 'UI Policy - Enforce SLA justification when SLA is at risk' form in ServiceNow. The form includes a 'Short description' field (Enforce SLA justification when SLA is at risk) and a 'When to Apply' section with a condition: 'SLA at Risk' is 'true'. It also shows Application (Global) and Active (checked). Below the form are buttons for 'Update' and 'Delete', and a 'Related Links' section with links like 'Advanced view' and 'Run Point Scan'. At the bottom, there are tabs for 'UI Policy Actions (3)' and 'UI Policy Related List Actions', followed by a table header for 'UI policy = Enforce SLA justification when SLA is at risk' with columns: for text, Search, and Actions on selected rows...

5.SLA Attachment and running

Groups such as Incident Management Team and Support Team are created. Users belonging to the same department are added to these groups, making it easier to assign incidents and manage permissions.

The screenshot displays the ServiceNow interface for an incident. At the top, there are three summary cards showing incident details: 'Assigned to' (Don Goodlife), 'Incident state' (In Progress), and 'Field changes' (2026-06-27 04:01:56). Below these are 'Work notes' and 'Field changes' (2018-12-12 23:30:24). The main section shows 'Task SLAs (2)' with a table of SLA definitions. The table has columns: SLA definition, Type, Target, Stage, Business time left, Business elapsed time, Business elapsed percentage, Start time, and Stop time. The first row is 'Incident resolution-virtual agent govern' with a 0% completion. The second row is 'Priority 4 resolution (2 day)' with a 38.325% completion. The interface also includes buttons for 'Update', 'Resolve', 'Delete', and 'Responses', and a 'Related Links' section with links to 'Show SLA Timeline' and 'Repair SLAs'.

SLA definition	Type	Target	Stage	Business time left	Business elapsed time	Business elapsed percentage	Start time	Stop time
Incident resolution-virtual agent govern	SLA	Resolution	In progress	0 Seconds	0 Seconds	0%	2026-06-27 04:01:56	(empty)
Priority 4 resolution (2 day)	SLA	Resolution	In progress	0 Seconds	766 Days 12 Hours	38.325%	2018-08-30 01:06:52	(empty)

SLA Attachment allows users to upload supporting documents related to an SLA breach or justification request. These attachments provide evidence that helps managers review and validate the reason for the SLA breach.

Purpose

- Upload proof for SLA breach justifications.
- Maintain supporting documents for audit purposes.
- Improve transparency during the approval process.
- Keep all related evidence in one place.

Benefits

- Simplifies the justification review process.
- Provides clear evidence for approvals.
- Improves documentation and compliance.
- Reduces manual communication between users and managers.
- Ensures all SLA-related records are stored together.

6. SLA at Risk Trigger

Custom roles such as SLA Manager, Incident Analyst, and Support Engineer are created. These roles ensure that users can only access the features and records required for their work.

The screenshot shows the ServiceNow Workflow Studio interface for a flow named "SLA at Risk Notification". The flow is active and has a status of "Published". The interface includes a top navigation bar with the ServiceNow logo and the flow name. Below the navigation bar, there is a "TRIGGER" section with a single trigger: "Task SLA Created or Updated where (SLA definition is Incident Resolution- Virtual Agent Gove, and Business elapsed percentage greater than or is 80)". The "ACTIONS" section contains four actions: "Look Up Incident Record where (Sys ID is Trigger - Record ...)", "Update Incident Record", "Send Email", and "Send Email". The "ERROR HANDLER" section is currently disabled. The right sidebar shows the "Data" panel with a list of variables and their types.

Variable	Type
Task SLA Record	Record
Changed Fields	Array.Object
Task SLA Table	Table
Run Start Time UTC	Date/Time
Run Start Date/Time	Date/Time
Incident Record	Record
Incident Table	Table
Status	Choice
Error Message	String
Action Status	Object

The screenshot shows the ServiceNow Workflow Studio interface for the "SLA at Risk Notification" flow. The trigger configuration is expanded, showing the following details:

- Trigger: Created or Updated
- * Table: Task SLA [task_sla]
- Condition: SLA definition is Incident Resolution- Virtual Agent Gove (OR) Business elapsed percentage greater than or is 80
- Run Trigger: Once

The "ACTIONS" section shows the first action: "Look Up Incident Record where (Sys ID is Trigger - Record ...)". The right sidebar shows the "Data" panel with a list of variables and their types.

Variable	Type
Task SLA Record	Record
Changed Fields	Array.Object
Task SLA Table	Table
Run Start Time UTC	Date/Time
Run Start Date/Time	Date/Time
Incident Record	Record
Incident Table	Table
Status	Choice
Error Message	String
Action Status	Object

7. SLA Notification & Email

To provide users with appropriate access permissions.

After creating users and roles, each user is assigned the required role. This implements Role-Based Access Control (RBAC), ensuring secure and controlled access to the application.

8.UI policy assignee - Access

A custom table is created to maintain records such as Incident Number, SLA Status, Breach Time, Assigned Group, Priority, and Breach Reason. This table helps monitor SLA performance efficiently.

The screenshot shows the ServiceNow UI Policy configuration page. The title is "UI Policy - Enforce SLA justification when SLA is at risk, UI P...". The "When to Apply" section shows a condition: "SLA at Risk" is "true". Below this, there are "Update" and "Delete" buttons. The "Related Links" section includes "Advanced view" and "Run Point Scan". The "UI Policy Actions (3)" section shows a table of actions:

Field name	Mandatory	Visible	Read only
u_sla_breach_justification	True	True	Leave alone
u_sla_breach_reason	True	True	Leave alone
u_sla_acknowledged	Leave alone	True	Leave alone

The screenshot shows the ServiceNow Dictionary Entry configuration page for "SLA Breach Reason". The "Table" is "Incident [Incident]" and the "Type" is "Choice". The "Column label" is "SLA Breach Reason" and the "Column name" is "u_sla_breach_reason". The "Application" is "Global", "Active" is checked, "Function field" is unchecked, "Mandatory" is unchecked, "Display" is unchecked, and "Read only option" is "-- None --". Below this, the "Choice List Specification" section shows the "Default Value" field. The "Default value" field is empty. Below this, there are "Create Choice List", "Delete Column", and "Update" buttons. The "Related Links" section includes "Show Table", "Run Point Scan", and "Advanced view".

9.Virtual agent Invocation

A custom table is created to capture information such as Incident Number, Justification, Submitted By, Approval Status, Manager Comments, and Submission Date. This helps track explanations for SLA violations.

10.SLA Acknowledgement via virtual agent

11.SLA Breach by Reason

The SLA Manager role is assigned to the SLA Breach table, while authorized users can access the Justification table. This ensures that only eligible users can create, view, or modify records.

12..Acknowledged vs Unacknowledged

ACLs are configured to control access to important fields. Only users with the required roles can view or update information such as SLA Status, Justification, Assigned To, and Priority.

Acknowledged vs Unacknowledged Breaches

13.Pending Justification

A Flow Designer workflow automatically detects incidents approaching an SLA breach. It sends alerts to assigned users, creates a justification request if needed, routes it for manager approval, and updates the incident based on the approval outcome. This reduces manual effort and improves SLA compliance.

Pending Justifications														
Number	Opened	Short description	Caller	Priority	State	Category	Assignment group	Assigned to	Updated	Updated by	SLA at Risk	SLA Breach Justification	SLA due	
INC0009005	2018-08-31 21:35:21	Email server is down.	David Miller	1 - Critical	In Progress	Software	Hardware	Fred Luddy	2024-06-30 22:48:13	system	true	true	UNKNOWN	
INC0010003	2024-06-20 19:01:53	SLA Test Incident	Bud Richman	4 - Low	In Progress	Software	Service Desk	David Loo	2024-06-28 23:20:58	admin	true	true	UNKNOWN	
INC0009009	2018-08-30 01:06:16	Unable to access the shared folder.	David Miller	4 - Low	In Progress	Inquiry / Help	Software	Don Goodliffe	2024-06-26 08:31:11	system	true	true	UNKNOWN	

14.SLA Performance Trend

SLA Performance Trend is a report or dashboard that shows how Service Level Agreement (SLA) performance changes over a period of time. It helps organizations monitor whether SLA targets are being consistently achieved and identify patterns that may require improvement.

15. Dashboard SLA governance view

The SLA Governance Dashboard provides managers and administrators with a centralized view of SLA performance across the organization. It helps monitor SLA compliance, identify potential SLA breaches, and track the status of breach justifications in real time.
