

REQUIREMENT ANALYSIS PHASE

Project Title:

SLA Breach Awareness and Justification System

Requirement Analysis

The Requirement Analysis phase is one of the most important phases in the Software Development Life Cycle (SDLC). In this phase, the requirements of the SLA Breach Awareness and Justification System are collected, analyzed, and documented. The system is designed to monitor Service Level Agreements (SLAs), notify users about potential or actual SLA breaches, and provide a mechanism for recording and approving breach justifications.

Customer Journey Map

The Customer Journey Map documents the end-to-end experience of the IT Service Manager and Service Desk Agent as they interact with the SLA management process — from the moment an incident is raised to the post-breach justification and reporting phase.

Stage	1.Incident Reised	2.SLA Warning	3.SLA Breach	4.VA Justification	5.Reporting & Review
Actions	Agent Assigned; ticket logged in Servicenow	System sends proactive alert; VA nudges agent	Business Rule triggers VA conversation	Agent provides structured justification via VA chatbot	Manager reviews breach report and justification
Touch points	ServiceNow incident module	Email Notification+ VA Alert	Virtual agent chatbot dialog	VA conversation+ incident Notes	Performance Analytics Dashboard
Pain Points	No SLA visibility at assignment	Alerts buried in inbox; missed warnings	No structured breach notification	Manual and inconsistent justification entry	No aggregated view of breach root causes
Opportu-nities	Display SLA timer at assignment	VA proactive pre-breach alert	Automated VA breach conversation trigger	Structured VA dialog with predefined categories	Automated report generation with trend analysis

Functional Requirements

- User registration and secure login.
- Role-based access (Admin, Manager, Employee).
- Create, update, and manage SLA records.
- Track SLA deadlines automatically.
- Send notifications before and after SLA breaches.
- Record and manage breach justifications.
- Manager approval or rejection of submitted justifications.
- Generate SLA breach reports and performance reports.
- Maintain an audit trail of all activities.

Non-Functional Requirements

- Secure authentication and data privacy.
- Fast system response time.
- High availability and reliability.
- User-friendly interface.
- Scalable architecture to support future growth.
- Easy maintenance and backup support.

Hardware Requirements

- Processor: Intel Core i3 or above
- RAM: 4 GB minimum (8 GB recommended)
- Storage: 100 GB free disk space
- Internet connection

Software Requirements

- Operating System: Windows 10/11 or Linux
- Frontend: HTML, CSS, JavaScript
- Backend: Java / Python / PHP
- Database: MySQL
- Web Server: Apache Tomcat/XAMPP
- Browser: Google Chrome, Microsoft Edge, or Mozilla Firefox

Outcome

The Requirement Analysis phase ensures that all user and system requirements are clearly identified and documented before moving to the design and development phases. This helps in building a reliable, efficient, and user-friendly SLA Breach Awareness and Justification System.

REQUIREMENTS ANALYSIS & PLANNING

Project: SLA Breach Awareness and Justification System

1. Business Objectives

- Analyze SLA breach challenges in incident management.
- Identify business requirements for proactive SLA monitoring.
- Define objectives for breach awareness and justification.
- Document expected business benefits.
- Review and finalize business objectives.

2. Functional Scope

- Configure SLA definitions and breach conditions.
- Develop Virtual Agent for SLA breach alerts.
- Enable users to submit SLA breach justifications.
- Configure notifications using Flow Designer.
- Create reports and dashboards for SLA monitoring.
- Define out-of-scope features.

3. Stakeholder Mapping

- Identify Service Desk Agents.
- Identify Incident Managers.
- Identify End Users.
- Identify System Administrators.
- Assign stakeholder roles and responsibilities.

4. Execution Roadmap

- Gather and analyze requirements.
- Configure backend and SLA policies.
- Develop Virtual Agent conversations.
- Configure Flow Designer notifications and UI Policies.
- Create dashboards and reports.
- ,Perform testing and validation.
- Prepare project documentation and demo.

Objectives

- To monitor Service Level Agreement (SLA) deadlines effectively.
- To provide early alerts and notifications before SLA breaches occur.
- To reduce SLA violations through timely awareness.
- To allow users to submit valid justifications for SLA breaches.
- To help managers review and approve/reject breach justifications.
- To improve accountability, transparency, and service quality.
- To generate reports for monitoring SLA performance and compliance.

Benefits

- Reduces the number of SLA breaches.
- Improves response and resolution times.
- Increases employee accountability.
- Simplifies the process of recording and managing breach justifications.
- Enhances customer satisfaction by ensuring timely service delivery.
- Provides detailed reports for better decision-making.
- Saves time through automated notifications and tracking.
- Improves overall organizational efficiency

Conclusion

The SLA Breach Awareness and Justification System is an efficient solution for monitoring SLA commitments and minimizing service delays. It provides timely alerts, enables users to submit justifications for breaches, and helps managers track and review SLA performance. By improving transparency, accountability, and operational efficiency, the system supports better service management and enhances customer satisfaction.
